ART UNIT

PAPER NUMBER

2128

MAIL DATE

DELIVERY MODE

06/10/2009

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 04 May 2009 has been entered.
2. Claims 1 and 3-19 have been presented for examination. Claim 2 has been cancelled.

Response to Arguments

3. In view of Applicant's amendments, the previously issued 35 U.S.C. 112 rejection is withdrawn.
4. Applicant's arguments filed 04 May 2009 regarding the prior art rejection have been fully considered but they are not persuasive.

Regarding the prior art rejection:

- i. **Applicant submits**, regarding claims 1, 13 and 14, that "...there is no disclosure in Sarvar that the executing step executes the simulation of the second step by sampling the output based on the simulation condition."

Examiner interprets "analysis result data" to be any data produced in the first simulation step that is then analyzed and/or sampled in the second simulation step, and "wherein analysis result data simulated previously based on a plurality of conditions are generated every step" to mean that this data is produced at every step. Examiner notes page 131 ("Modeling Variable Materials Data), which discloses varying the specific heat capacity to record the temperature changes). Thus, the initial simulation of the heat flow is used to simulate the heat capacity, which is used to simulate the change in temperature.

Claim Objections

5. **Claim 3 is objected to under 37 CFR 1.75(c)**, as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. Examiner notes MPEP 608.01(n), which states: "Any claim which is in dependent form but which is so worded that it, in fact is not, as, for

example, **it does not include every limitation of the claim on which it depends**, will be required to be canceled as not being a proper dependent claim...”

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. **Claim 13 is rejected under 35 U.S.C. 102(b)** as being clearly anticipated by Sarvar (“**Effective Modeling of the Reflow Soldering Process: Basis, Construction, and Operation of a Process Model**”)

Regarding claim 13:

Sarvar discloses a mounting process simulation system provided to steps of a mounting process composed of a plurality of steps to execute a simulation of the mounting process, comprising:

- a. an inputting portion for inputting a plurality of conditions to execute the simulation
(figure 1; IV.B; table III: heat flow, specific heat capacity)
- b. an executing portion for executing the simulation based on the condition input from the inputting portion **(figure 1)**
- c. an outputting portion for outputting a result of the simulation executed by the executing portion **(figure 1)**
- d. wherein the executing portion includes:
 - i. a condition table forming portion that forms a condition table of a second step positioned subsequently to a first step, whereby the condition table is formed by using a simulation result simulated based on a first condition selected for at least a first step, of a second step positioned subsequently to a first step **(IV.B: first condition is heat flow and first simulated result is specific heat capacities. The**

- specific heat capacities is modeled using an interpolation table. The first step is varying the heat capacity, and the second step is measuring the temperature).**
- ii. simulation result outputting portion executes the simulation of the second step based on the condition data from the condition table and a condition input from the inputting portion (**section V.A: user inputs process conditions**) and outputs a result to the outputting portion (**page 131 ‘Modeling Variable Materials Data’ paragraphs 1-3: The variation of the temperature is calculated based on this first condition.**).
- e. wherein analysis result data analyzed based on a plurality of conditions are generated at every step and wherein the executing portion executes the simulation of the second step by sampling the analysis result data generated based on the simulation condition (**page 131 ‘Modeling Variable Materials Data’ paragraphs 1-3: varying the specific heat capacity to record the temperature changes**).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the

obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(e) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

7. **Claims 1, 3-12 and 14-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sarvar et al. ('Effective Modeling of the Reflow Soldering Process: Basis, Construction, and Operation of a Process Model') in view of Ekere ("Solder Paste Printing Process Modeling Map").**

Regarding claims 1 and 14:

Sarvar discloses a mounting process simulation program of causing a computer to execute a simulation of a mounting process composed of a plurality of steps, and a method of executing a simulation, comprising:

- a. a first simulation executing step of executing a simulation **(IV.B: specific heat capacity calculated (i.e. simulated))** based on a first condition selected for a first step **(IV.B: heat flow)**.
- b. a simulation condition deciding step of selecting a simulated result from the first simulation executing step as a simulation condition for a second step positioned subsequent to the first step **(Table III; 'Modeling of an Exemplar Product and Process Combination': the specific heat capacity is varied, and this value is used to calculate the peak temperatures) .**
- c. a second simulation executing step of executing a simulation-of the second step based on a second condition containing at least the simulation condition **(section V.B)** and a third condition **(section V.A: user inputs process conditions)** that yields a second simulation result that is displayed **(Table III)**, wherein the first simulation executing step and the second simulation executing step are each directed to different successive steps in the plurality of steps composing the mounting process **(section V.B: multiple steps are simulated, such as the simulation of the variable heat capacity values, simulation of the peak temperature, simulation of the oven, etc)**
- d. wherein analysis result data analyzed based on a plurality of conditions are generated at every step and wherein the second simulation executing step executed the simulation of the second step by sampling the analysis result data generated based on the second condition **(page 131 'Modeling**

Variable Materials Data' paragraphs 1-3: varying the specific heat capacity to record the temperature changes)

Sarvar does not explicitly disclose simulating printing or mounting. **Ekere teaches** simulating solder paste printing (**Ekere: abstract**). At the time of the invention, it would have been obvious to one of ordinary skill in the art to combine the teachings of Sarvar and Ekere because solder paste printing is a crucial process in the reflow soldering of surface mounted electronic components (**Ekere: abstract**).

Regarding claim 3:

Sarvar discloses generating no simulated analysis result data analyzed based on a plurality of conditions at every step and executing the simulation of the second step by executing an interpolation calculation using the analysis result data which is simulated based on an analyzed condition of the second condition (**page 131 'Modeling Variable Materials Data' paragraphs 1-3: varying the specific heat capacity to record the temperature changes**). The variable behavior of the specific heat capacity is represented in the models using *interpolation tables for each variable material*. **Sarvar discloses** simulating a typical reflow profile (**page 128 'Radiative Heating'**). The temperature is varied with time (*conditions*), and this data is used to calculate the output. Therefore, the output (*analysis data*) is calculated during *each* temperature variation. The Examiner interprets 'analysis result data' to be any data produced in the first simulation step that is then analyzed and/or sampled in the second simulation step, and 'wherein analysis result data simulated previously based on a plurality of conditions are generated every step' to mean that this data is produced at every step.

Regarding claim 4:

Sarvar discloses executing the simulation of the second step by converting the analysis result data generated by other device into predetermined data format (**page 129 'Specific Heat Capacity Values' 1st paragraph: deriving the specific heat capacity by using the heat flow from samples analyzed with a calibrated Mettler TA3000 differential scanning calorimeter**). This is analogous to the outside device in the claim language. The derived value is then converted to a computed-readable value and used in the simulation (**page 132 'Modeling of an Exemplar Product and Process Combination' paragraph 1**). **Sarvar discloses** simulating a typical reflow

profile (**page 128 ‘Radiative Heating’**). The temperature is varied with time (*conditions*), and this data is used to calculate the output. Therefore, the output (*analysis data*) is calculated during *each* temperature variation. The Examiner interprets ‘analysis result data’ to be any data produced in the first simulation step that is then analyzed and/or sampled in the second simulation step.

Regarding claim 5:

Sarvar discloses the simulation program of claim 4 wherein the experimental data simulated at every step via a CAE tool is selected as the analysis result data (**page 127 ‘Outline of System Components’ 2nd paragraph; page 129 ‘Specific Heat Capacity Values’ paragraph 1**), wherein the type of data selected as the analysis result data is converted to a predetermined format (**figure 1 post processing and data presentation**). The specific heat capacity is experimentally derived and is then used in the simulation as the analysis result data to calculate its effect on the temperature variation (**page 132 ‘Modeling of an Exemplar Product and Process Combination’ paragraph 1**).

Regarding claims 6 and 19:

Sarvar discloses a mounting process simulation program according to claim 1, further causing the computer to execute an animation displaying step of displaying three-dimensionally an animation to indicate a result simulated in the second simulation executing step on a display device, by reading previously- stored animation elements based on a definition file in which an operation sequence is defined every step (**figure 8; page 132 ‘Modeling of an Exemplar Product and Process Combination’ paragraph 1**).

Regarding claim 7:

Sarvar discloses a mounting process simulation program according to claim 1, wherein the second simulation executing step includes a condition acquiring step of reading a condition selected in response to an input from a condition database in which a plurality of conditions are stored previously in combination, and adding the condition to the second condition (**page 131 ‘Modeling Variable Materials Data’ paragraph 3**). The specific heat capacity is modeled using tables.

Regarding claim 8:

Sarvar discloses a mounting process simulation program according to claim 7, wherein the condition acquiring step further reads data from a CAD system in response to the input and adds the data to the second condition (**figure 1**).

Regarding claim 9:

Sarvar discloses a mounting process simulation program according to claim 1, wherein the first simulation executing step executes the simulation to contain production variation in the first step (**Table III: production variation specific heat capacity**), the simulation condition deciding step decides the result simulated in the first simulation executing step to contain the production variation as the simulation condition and the second simulation executing step executes the simulation of the second step based on the second condition to contain the production variation (**Table III: simulation to determine variation in temperature due to variation in specific heat capacity**).

Regarding claim 10:

Sarvar discloses a mounting process simulation program according to claim 1, wherein the first simulation executing step executes the simulation based on a change of a control item set in the first step as the first condition (**IV.B first condition is heat flow**), the simulation condition deciding step decides the result simulated based on the change of the control item in the first simulation executing step as the simulation condition (**IV.B first simulation calculated specific heat capacities**), and the second simulation executing step executes the simulation of the second step based on the second condition to contain the result simulated based on at least the change of the control item (**Table III: simulation to determine variation in temperature due to variation in specific heat capacity**).

Regarding claim 11:

Sarvar discloses a mounting process simulation program according to claim 1, further causing the computer to execute a reliability evaluating step of executing a reliability evaluation of a product manufactured in the mounting process by using the result simulated in the second simulation executing step (**figure 6**).

Regarding claim 12:

Sarvar discloses a mounting process simulation program according to claim 1, further causing the computer to execute a fraction defective calculating step of calculating a fraction defective of a product manufactured in the step and the second step, by using simulated results which were simulated in the first simulation executing step and the second simulation executing step (**Introduction: paragraphs 2 and 3**).

Regarding claims 15 and 17:

Sarvar discloses selecting the first, second, and third condition from a plurality of simulated conditions (**section IV.B; table III**). The plurality of conditions include the specific heat capacities, the heat flow, and the material properties.

Regarding claims 16 and 18:

Sarvar discloses the program of claim 15 wherein the plurality of simulated conditions include part conditions (**section IV.B heat flow**).

Conclusion

8. **Examiner's Remarks:** Examiner has cited particular columns and line numbers in the references applied to the claims above for the convenience of the applicant. Although the specified citations are representative of the teachings of the art and are applied to specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant in preparing responses, to fully consider the references in their entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the Examiner. In the case of amending the claimed invention, Applicant is respectfully requested to indicate the portion(s) of the specification which dictate(s) the structure relied on for proper interpretation and also to verify and ascertain the metes and bounds of the claimed invention.

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Shambhavi Patel whose telephone number is (571) 272-5877. The examiner can normally be reached on Monday-Friday, 8:00 am – 4:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kamini Shah can be reached on (571) 272-2279. The fax phone number for the organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
